

# Twitter Integration (as per updated Twitter API)

This guide is only intended for our HTML5 themes only

Twitter has updated their API so as the tweets ticker in splash page (twitter widget) will not work without new API migration. In order to make things better for you, we have added a fix for this, but you need to (it is mandatory by Twitter's new strategy) create a twitter application from twitter developer center:

<https://dev.twitter.com/>

We have created a Screencast video for you to help creating a Twitter App, please check it:

<http://screencast.com/t/aoE1IL4c>

According to the above demonstration, please copy following values:

**App Consumer Key, App Consumer Secret, App Access Token, App Access, Token Secret**

Now as seen in the video, please paste the above values inside **index.php** file. This file can be located as: **[ROOT]/TWITTER/INDEX.PHP**

Now open the following file: **[ROOT]/JAVASCRIPTS/SCRIPT.JS**

You can see the code segment for invoking Twitter such as:

```
$(function ($) {  
    $('#ticker').tweet({  
        .....  
    });  
});
```

please modify the code segment as shown below:

```
9 //TWITTER INIT (Updated with compatibility on Twitter's new API):  
10 //PLEASE READ DOCUMENTATION FOR INFO ABOUT SETTING UP YOUR OWN TWITTER CREDENTIALS:  
11 $(function ($) {  
12     $('#ticker').tweet({  
13         modpath: './twitter/',  
14         count: 5,  
15         loading_text: 'loading twitter feed flame...',  
16         username: 'designovastudio'  
17         /* etc... */  
18     });  
19 });
```

Please set the **username: 'designovastudio'** as your own username.

That's all. You must **upload and run the site from a web server** and everything will work properly.

If buyers need further assistance please contact us via Market Place profile page.
